# Lecture slides with LATEX A user friendly template

#### Pedro Fonseca

ISEG Lisbon School of Economics & Management

April 24, 2020

- Introduction
- 2 Some complicated formulas
- Code chunks
- 4 Conclusion
- 6 References

#### Before we start

You should remember the following topics from last lecture:

- Interesting topic 1
  - ▶ Interesting sub topic 1
  - ▶ Interesting sub topic 2
  - ▶ Interesting sub topic 3
- Interesting topic 2
- Interesting topic 3

Introduction 000

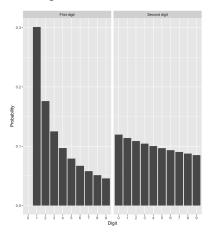

### In this lecture you will see:

- a plot
- some formulas
- some code
- some citations

## including pictures

## This picture is in the "figures" folder:

## Mathematical expressions

- Latex is very useful for expressions.
- Which is nice, since this lecture has lots of them!
- Lets see some Bayesian model selection formulas.

## Multinomial \( \) Dirichlet Model

- Likelihood:  $\mathbf{x}|\mathbf{\theta} \sim \mathcal{M}_k(N,\mathbf{\theta})$
- Hypotheses:  $H_0: \theta = \theta_0$  vs  $H_1: \theta \neq \theta_0$
- ullet Prior:  $\pi( heta|H_0)=1_{ heta_0}( heta_0)$  and  $heta|H_1,lpha\sim \mathsf{Dir}_k(lpha)$
- Marginal density:  $m_i(\mathbf{x}) = \int_{\Theta_i} f(\mathbf{x}|\boldsymbol{\theta}) \pi(\boldsymbol{\theta}|H_i) d\boldsymbol{\theta}, \quad i = 0, 1$

Bayes factor:

$$B_{01}(\mathbf{x}) = \frac{m_0(\mathbf{x})}{m_1(\mathbf{x})} = \frac{\prod_{i=1}^{k+1} (\theta_{0i}^{x_i}) \prod_{i=1}^{k+1} [\Gamma(\alpha_i)] \Gamma[\sum_{i=1}^{k+1} (\alpha_i + x_i)]}{\Gamma(\sum_{i=1}^{k+1} \alpha_i) \prod_{i=1}^{k+1} \Gamma(\alpha_i + x_i)}$$

- Likelihood:  $x \sim Bin(N, \theta)$
- Hypotheses:  $H_0: \theta = \theta_0$  vs  $H_1: \theta \neq \theta_0$
- Prior:  $\pi(\theta|H_0) = 1_{\theta_0}(\theta)$  and  $\theta|H_1 \sim \mathsf{Beta}(\mathsf{a},\mathsf{b})$
- ullet Marginal density:  $m_i(x) = \int_0^1 f(x| heta)\pi( heta|H_i)d heta,\ i=0,1$
- Bayes factor:  $B_{01}(x) = \frac{m_0(x)}{m_1(x)} = \frac{\theta_0(1-\theta_0)^{N-x} \Gamma(a) \Gamma(b) \Gamma(n+a+b)}{\Gamma(a+b) \Gamma(n+a-x) \Gamma(x+a)}$

- To learn about Bayes factors see Kass and Raftery, 1995.
- ullet For an interesting application of the Multinomial  $\wedge$  Dirichlet model see Pericchi and Torres (2011).

This lecture also has some examples with code. Lets print the Fibonacci sequence:

```
nterms = int(input("How many terms? "))
n1, n2 = 0, 1
count = 0
print("Fibonacci sequence:")
while count < nterms:
    print(n1)
    nth = n1 + n2
    n1 = n2
    n2 = nth
    count += 1
}
```

There is also a verbatin environment with background color.

```
getmode <- function(v) {
  uniqv <- unique(v)
  uniqv[which.max(tabulate(match(v, uniqv)))]
}</pre>
```

With this R code you can build a function that calculates the mode.

## summary

we talked about

- Kass, RE and AE Raftery (1995). Bayes factors. Journal of the American Statistical Association 90(430), 773–795.
- Pericchi, L and D Torres (2011). Quick anomaly detection by the Newcomb—Benford law, with applications to electoral processes data from the USA, Puerto Rico and Venezuela. *Statistical Science* **26**(4), 502–516.
